

Moving to composite seacocks?

Make the change, easier, faster and more cost effective with

Seabung

Watch a video of Seabung in action

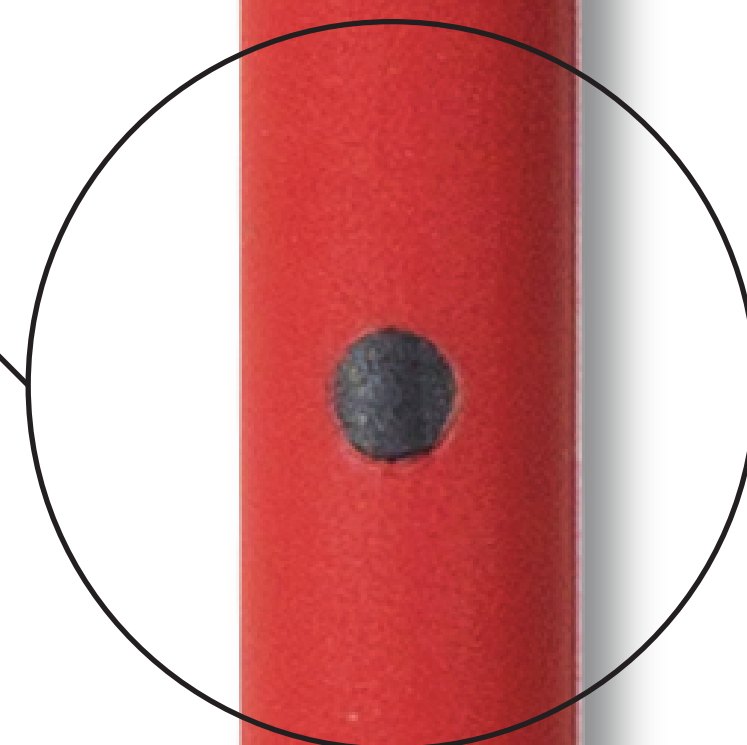

Secure

Seabung's moulded eyelet allows it to be tethered in place when an immediate repair is not possible

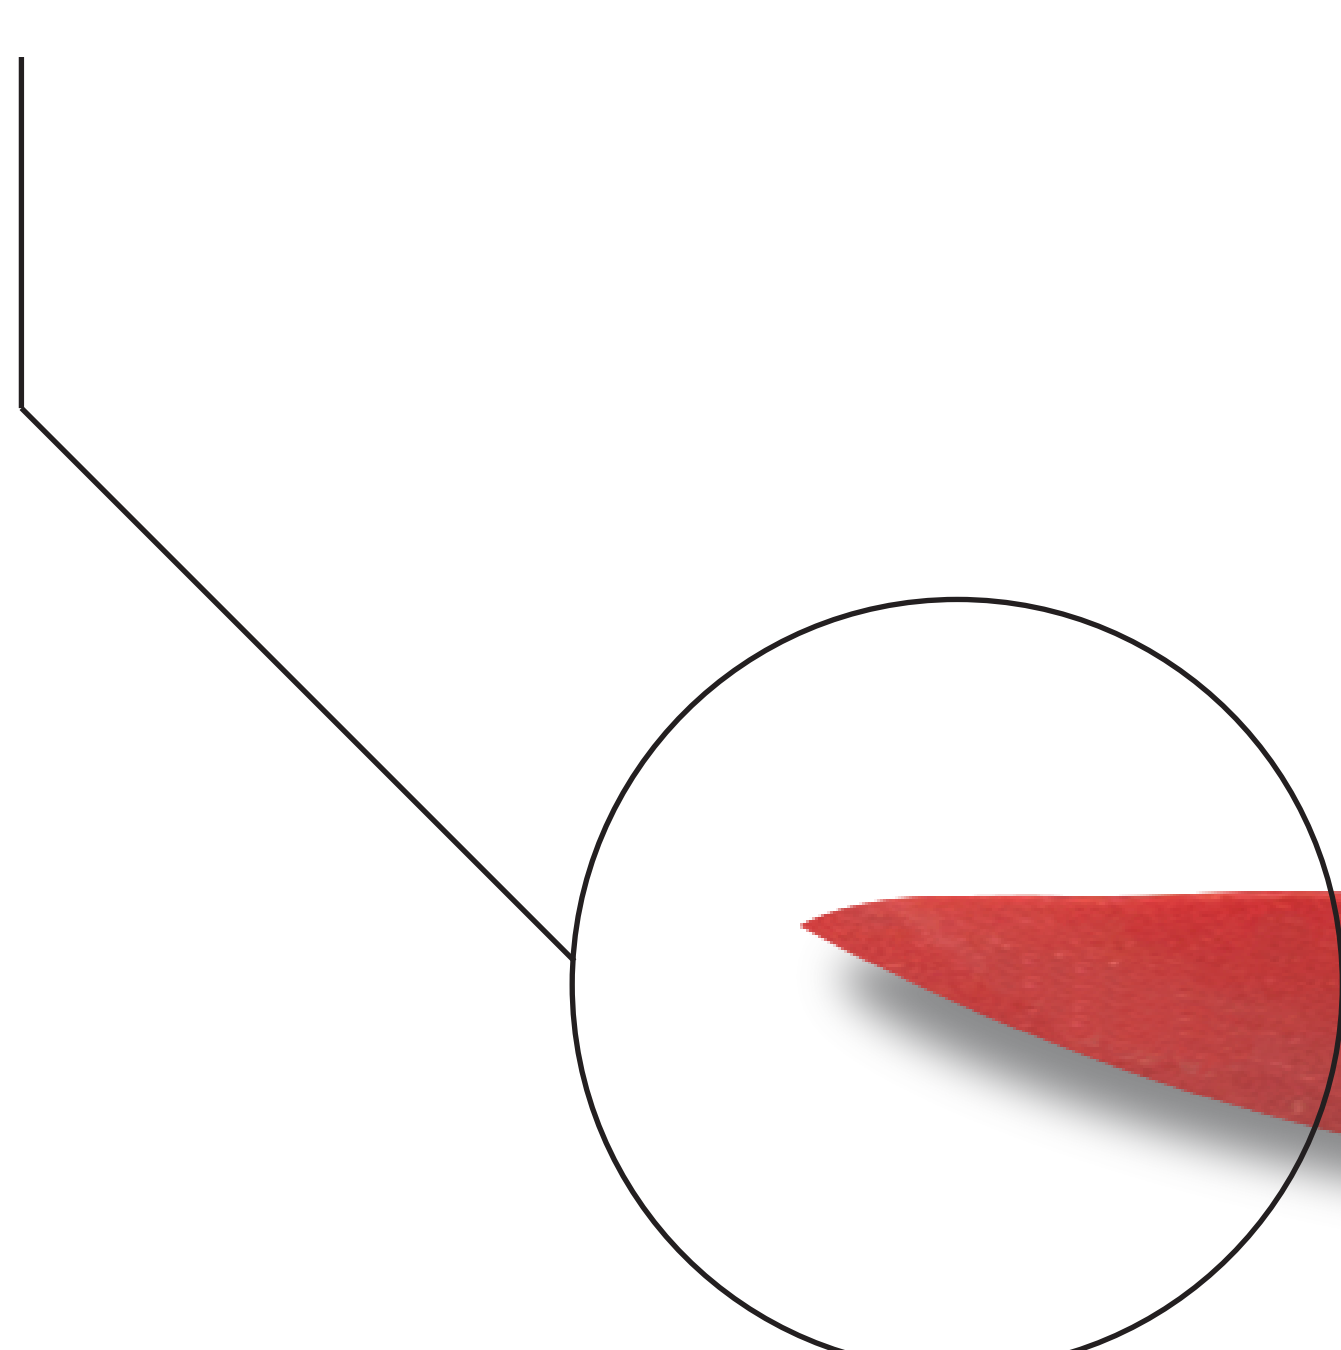

Durable

A tough ABS plastic core provides ultimate strength for application

Revolutionary

Seabung's unique flexible dome fits easily through a seacock or damaged area before pinging back into shape and stemming the flow of water

Often we sadly neglect the maintenance of our skin fittings due to the time and expense involved. Appearances can be deceptive and what we perceive to be a clean and effective seacock could be a dangerously corroded accident waiting to happen.

Underwater fitting failure is responsible for 50% of moored boat sinkage. Such a small piece of kit as a seacock or hose can be responsible for huge amounts of damage; even if a vessel has only been submerged for a short period of time the cost of repair is usually 40% of the value of the boat.

Seabung introduces a quick and simple way to schedule this critical job into your routine safety checks.
